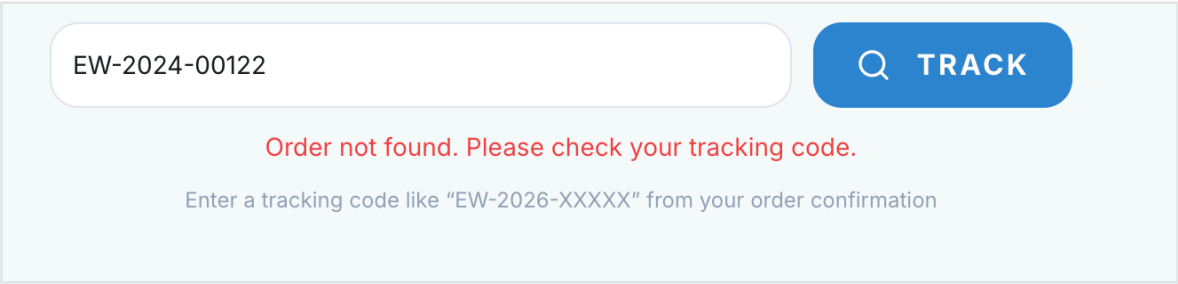
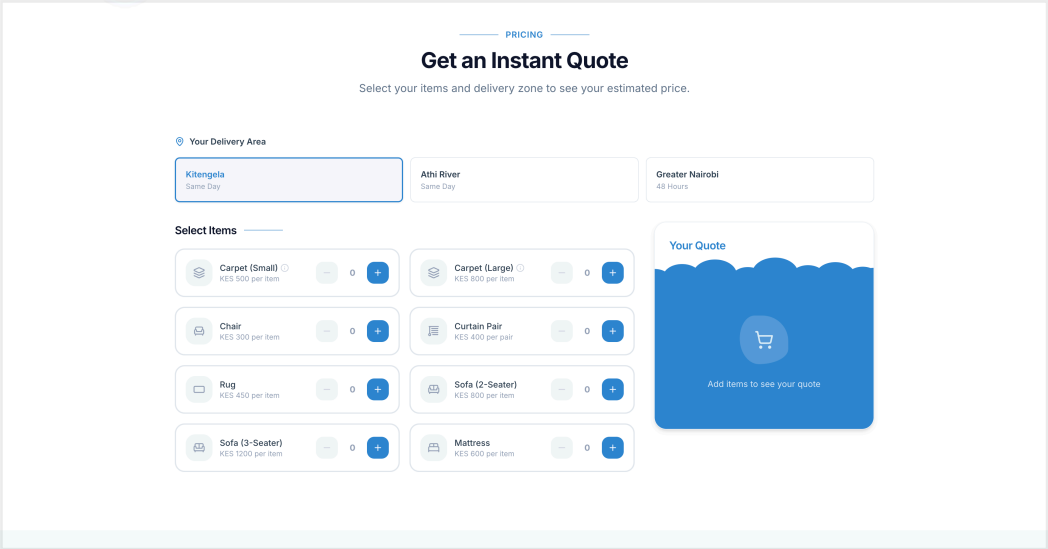
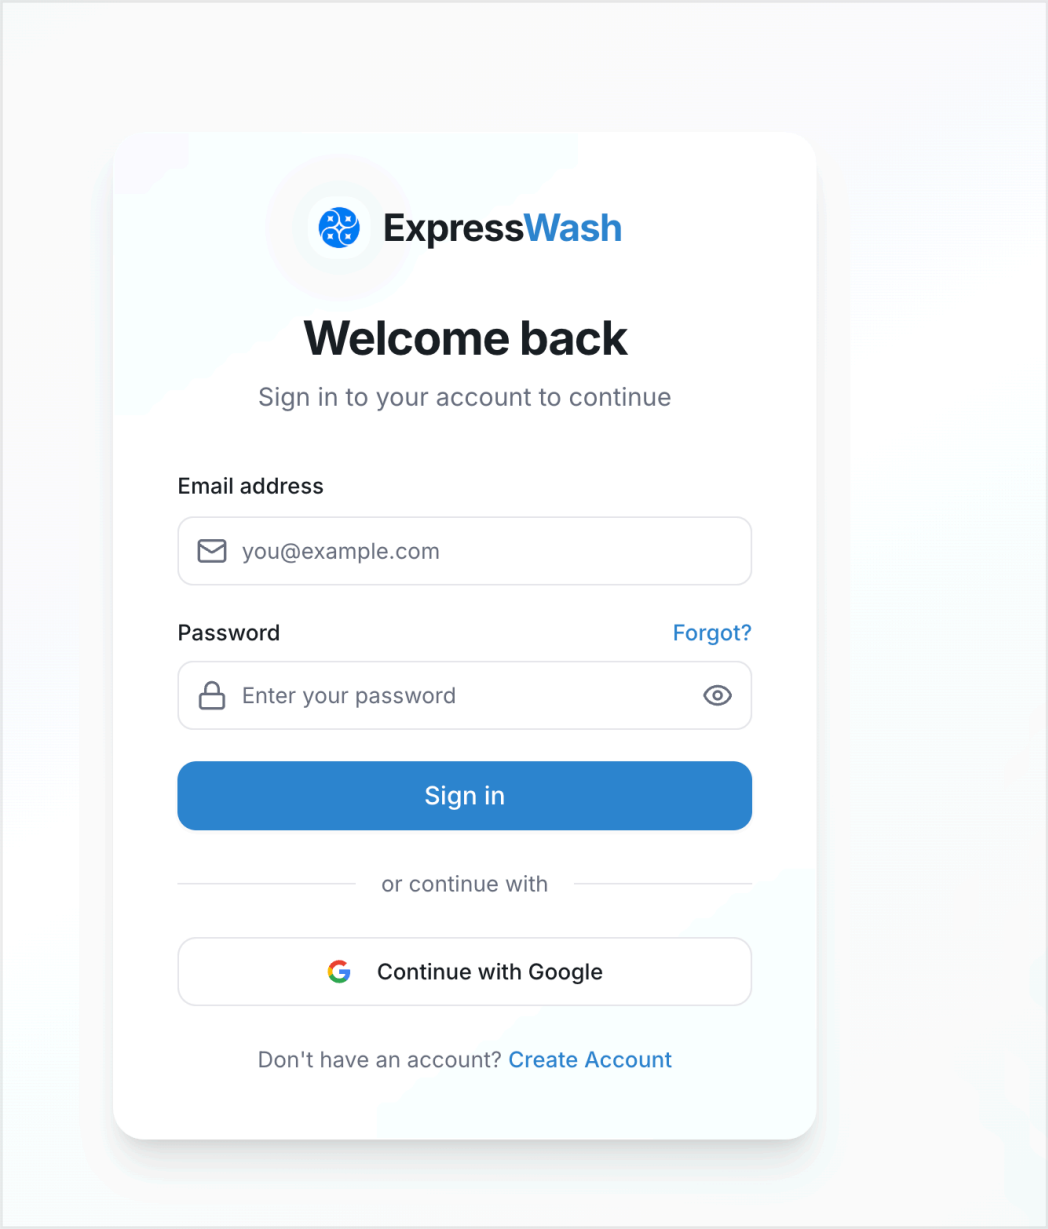
Express



Should have a better image for this



Include a bg image or something here. Maybe bubbles or something good here

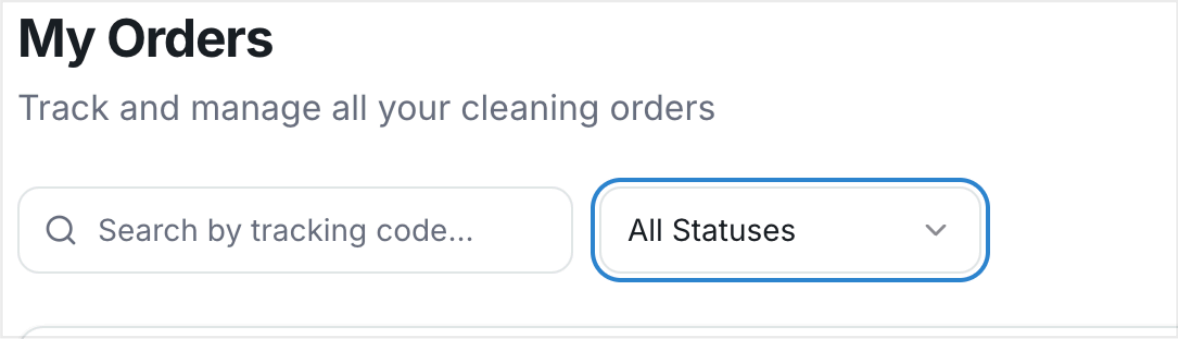


Include the logo to the bottom right and top left. Change the name to use the logo that has the name as well

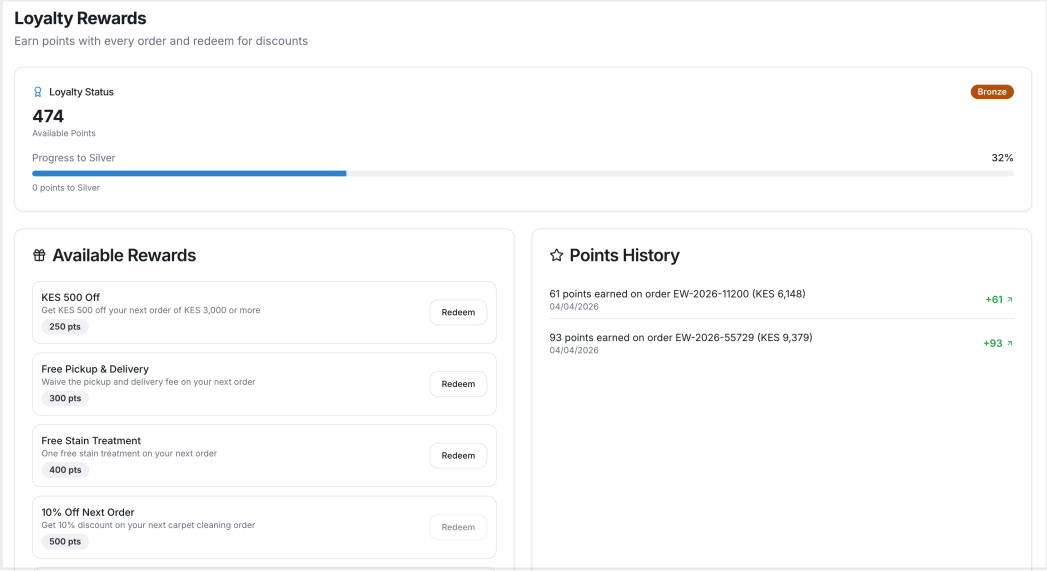
Default address when set doesn’t appear anywhere else e.g. when requesting a pickup
Add maps integration

Apply theme colours to rest of app dashboard with things like theme buttons

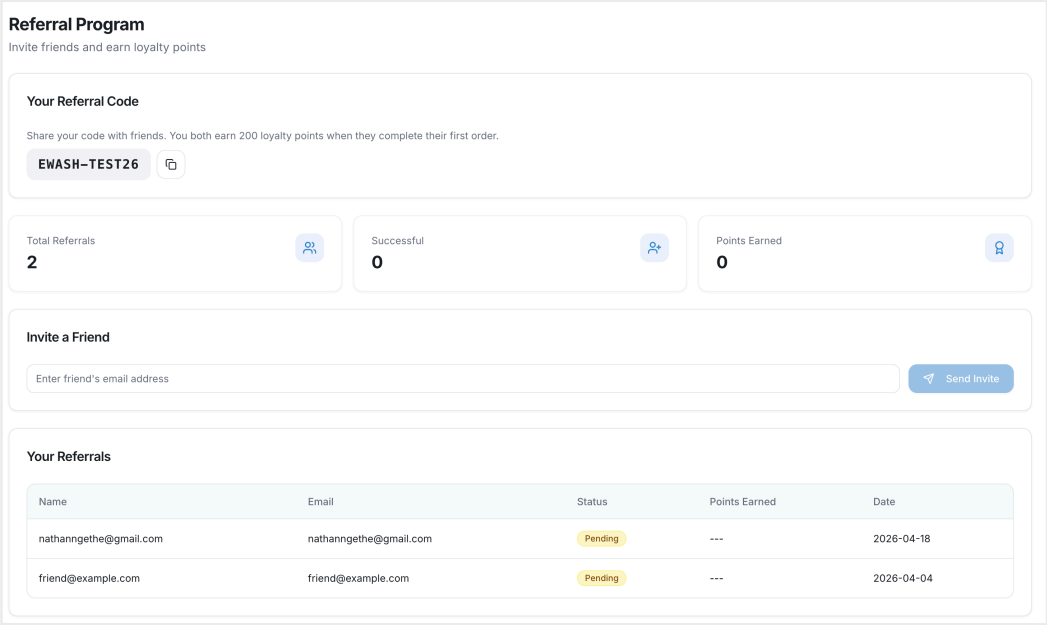
EW-2026-82802



This page is not paginated. And also not sorted by most recent

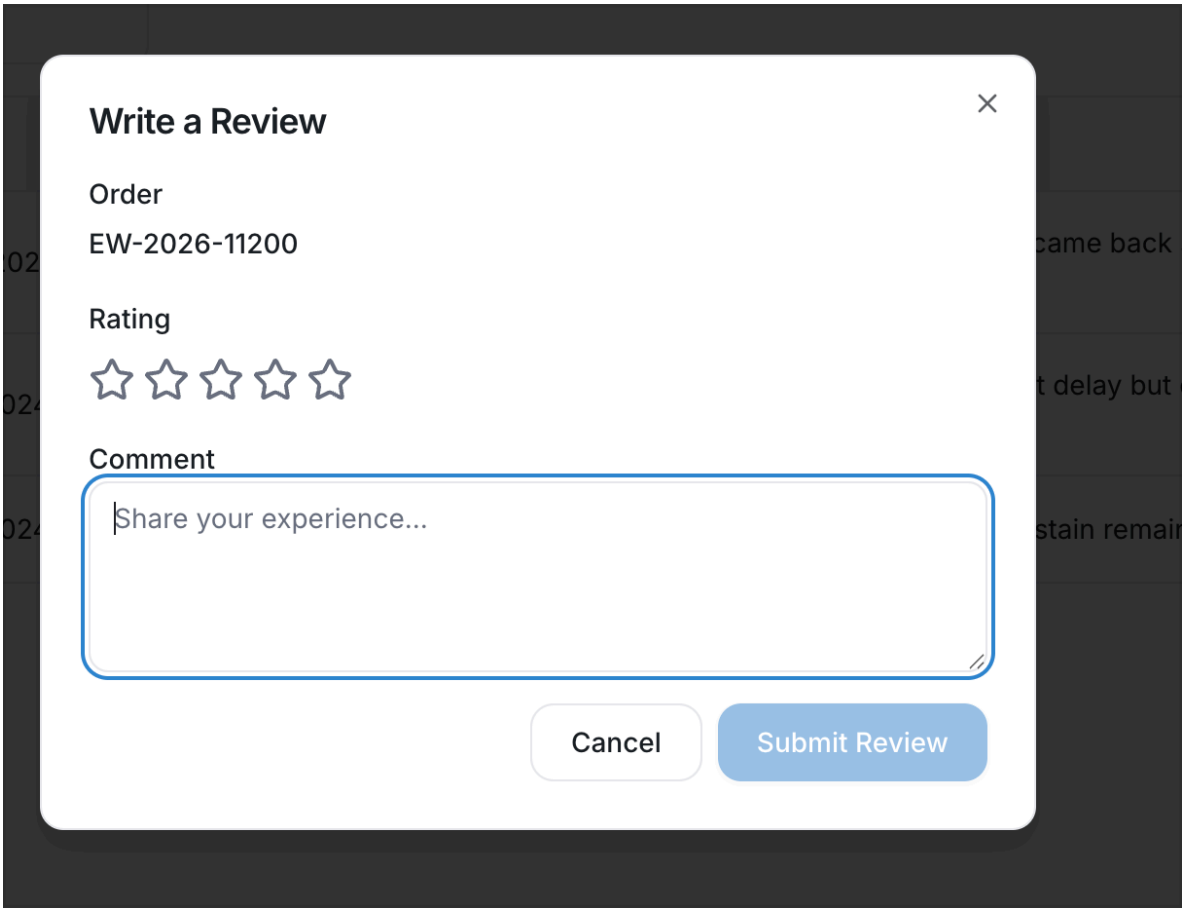


Is this based on actual data or not, it should be. And on redeeming act accordingly, and also act on orders based on the reward. Since it doesn't change on redeeming, and also I doubt it updates on purchases. Remember the calculation should also be ledger based instead of calculating on a single column whose value changes



This page needs to be functional. Sending an invite should earn points and also reflect on the loyalty and rewards page. And this will also help feed into the ledger based system for loyalty and rewards as discussed above. The code should also work, as well as the email invite

Notifications button does nothing at the moment on clicking. Should be functional



On clicking write a review, this should allow users to select the order based on

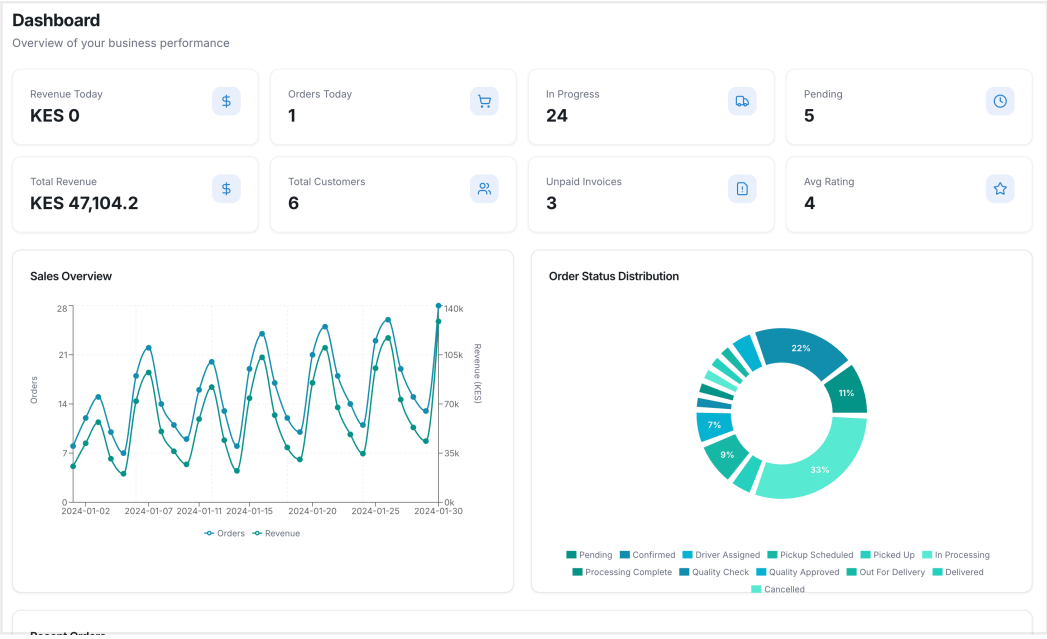
completed orders as a dropdown instead of this current flow.
Also for this part on reviewing an order that has no review, it should select the actual order, and should also be based on actual orders that have recently been completed and have no review. So there should be a link between an order and review if there is none at the moment:

Remove whatsapp notification/ show as “coming soon” on hover instead. Then same for sms notifications:

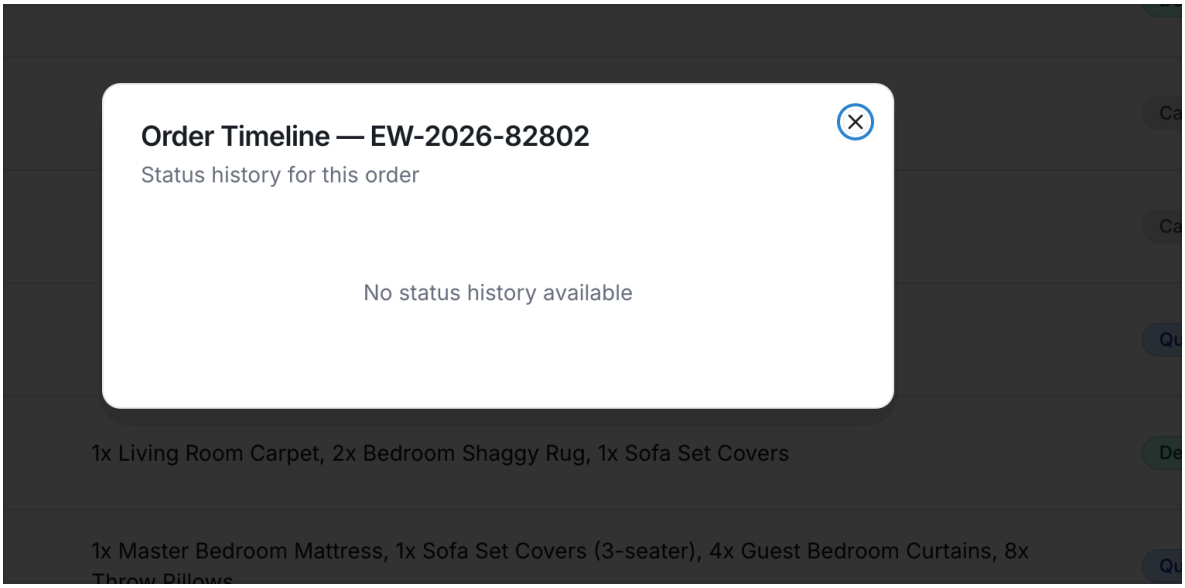
Notifications doesn’t seem to show on the UI
Addresses doesn’t persist, it only shows up on the UI. Then on reloading that page it doesn’t appear, it’s gone. Also the address when set should affect/ appear when I want to put an address elewhere.

Admin dashboard

This should all be based on actual data



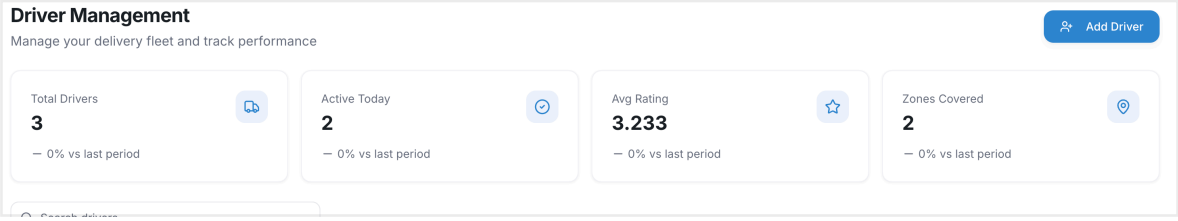
Status history on an order doesn’t show:



Also on the orders table, instead of having an eye icon to open the order, just have that row as clickable, and remove the eye icon, keep the history icon

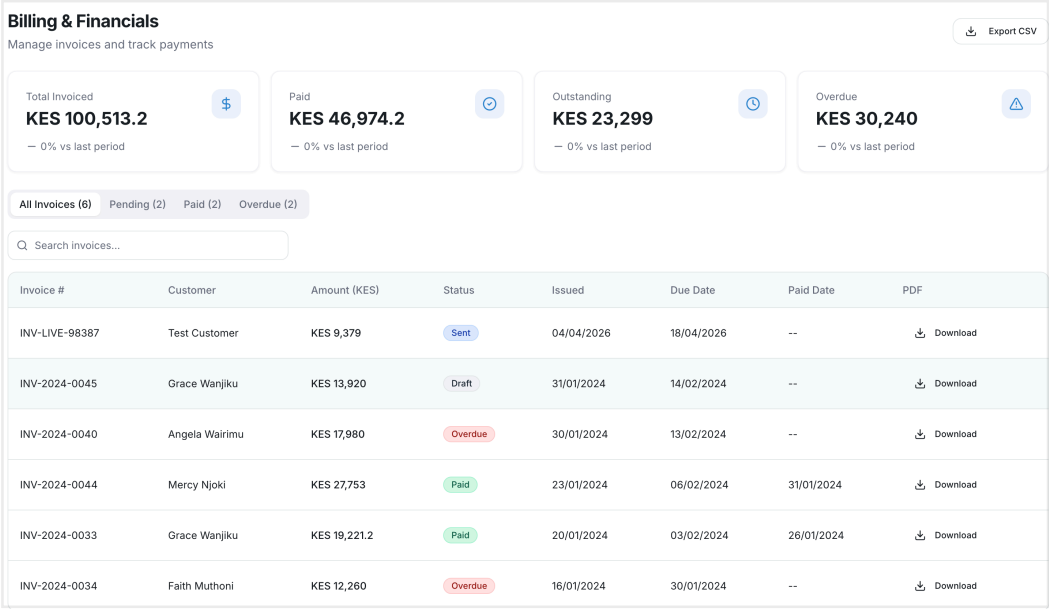
Clicking a user to view their profile doesn't work. Also the resultant page should show all their details that are linked to them on the user details page, not just their basic profile. This could be tabbed.

Clicking "add driver" does nothing



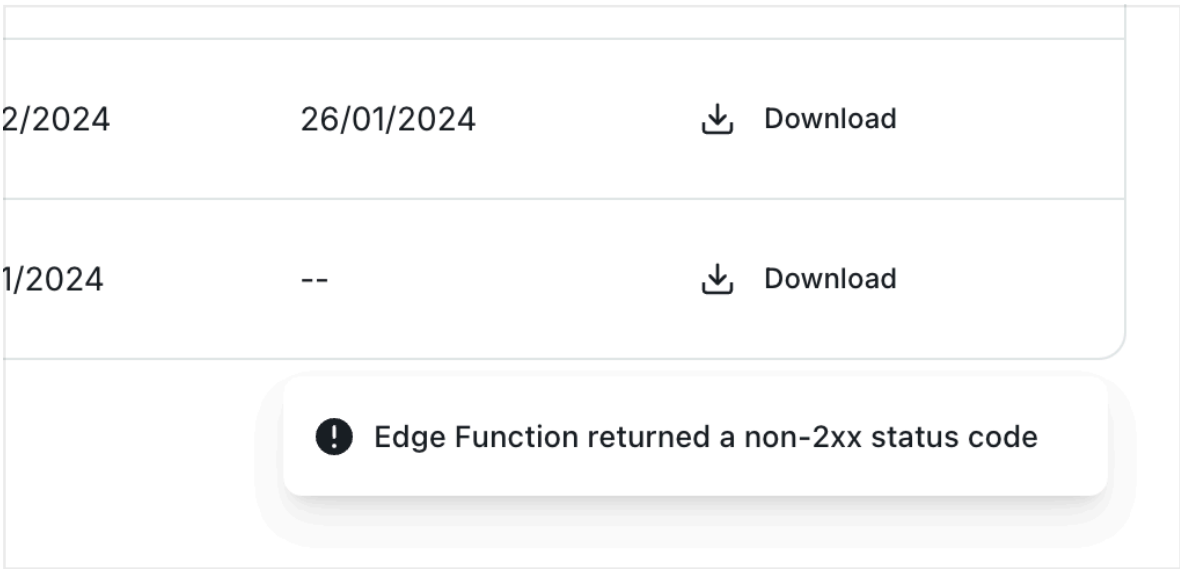
Also I can't edit the driver details from here or view their profile(open to the details page for users as discussed above.

This should be based on real data from the db:

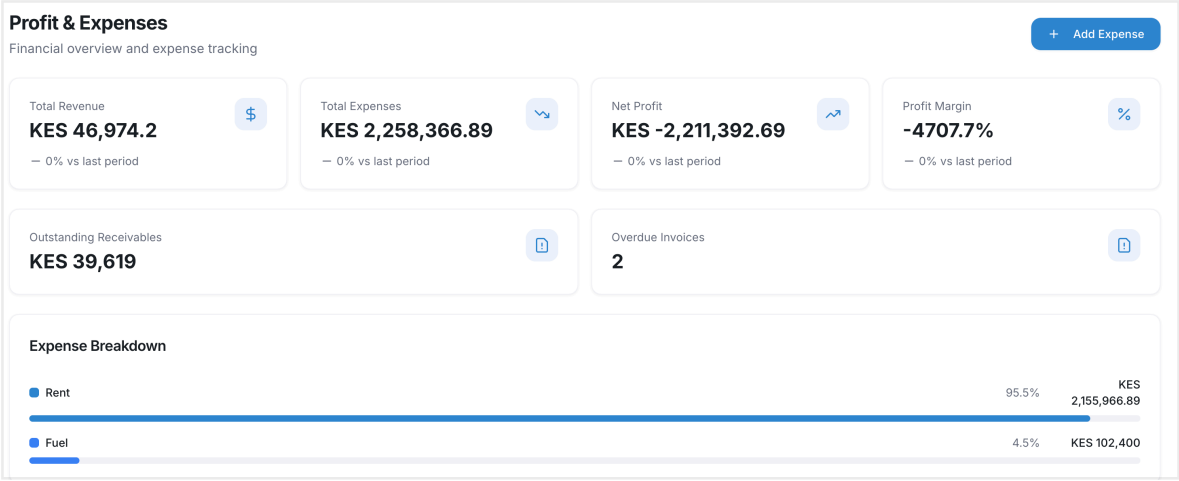


Paid date on the invoices doesn’t populate

Trying to download an invoice gets the following error:

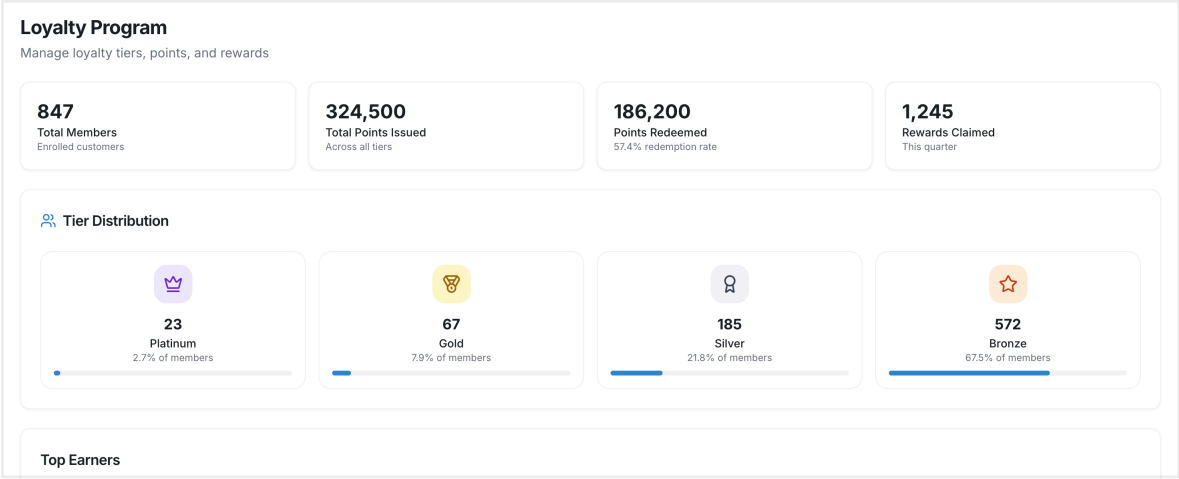


These values aren’t based on the expenses ledgers yet they should be:

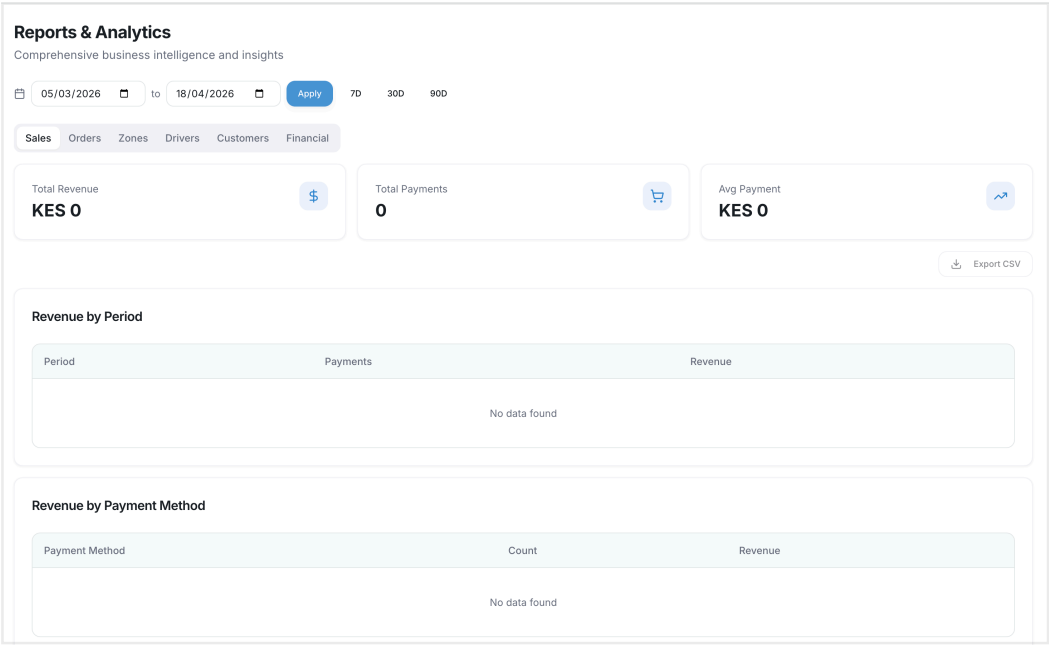


Also email notifications on cancelling an order fail

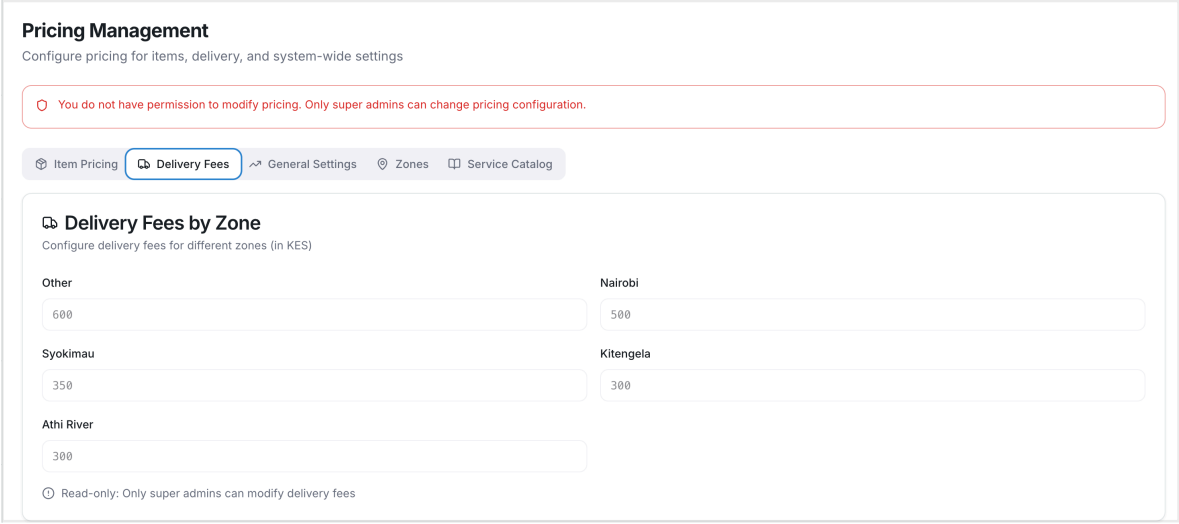
This page should also be based on real data(can be seeded but should come from db and be ledger based)

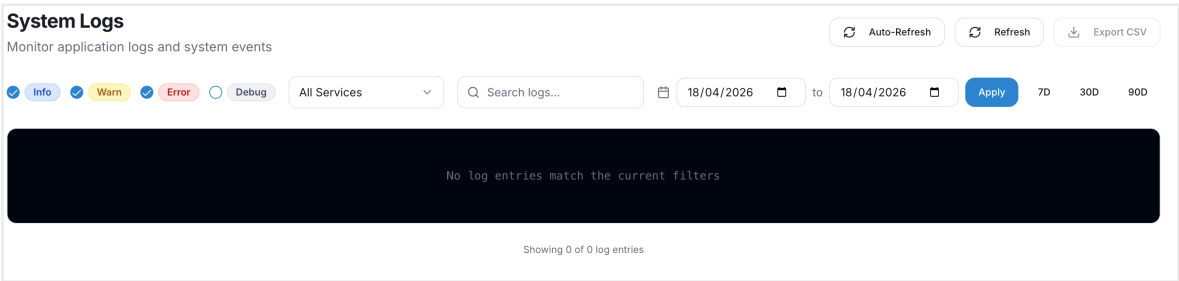


Reports page doesn't update based on db info since I had a payment on the customer page but it doesn't appear here



So every tab here should be based on real data.



Admins should be able to do this and we should keep an audit trail for this


Is this okay:
